

Using limma for Differential Expression

James W. MacDonald
jmacdon@med.umich.edu

BioC 2010
July 29, 2010

Overview

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Overall goal is to teach use of limma

- Example analyses
 - colonCA
 - estrogen
- Statistical discussions
 - Linear models
 - Experimental design
 - Design/contrast matrices
 - Multiple comparisons
- Visualization/output of results

Why limma?

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

- Fit nearly any model
- Technical replicates
- One/two color arrays
- Increased power

Why not limma?

BioC2010

Introduction

Colon Cancer
Data

Two-group
Filter/Output Data
Paired analysis

Estrogen Data

- Complexity
- Reliance on normal theory
- Can't fit linear mixed models
- Can't handle multiple levels of technical replication

Normal analysis workflow

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

- Import data
- Pre-process
- Fit model(s)
- Make comparisons
- Filter data
- Output results

Load Data

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Load data we will use today.

```
> x <- "http://www.umich.edu/~jmacdon/BioC2010.Rdata"  
> con <- url(x)  
> load(con)  
> close(con)
```

If using thumb drive, start R in directory containing BioC2010.Rdata, then

```
> load("BioC2010.Rdata")  
> ls()  
  
[1] "colonCA" "estrogen"
```

colonCA

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> library(Biobase)
> head(pData(colonCA))
```

	expNr	samp	class
1	1	-1	t
2	2	1	n
3	3	-2	t
4	4	2	n
5	5	-3	t
6	6	3	n

Simple t -test

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Assume no pairing

Two common parameterizations

Cell means model

Baseline model

These parameterizations are equivalent

The t -statistic

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

General form of a t -statistic

$$t = \frac{\hat{\beta}}{\frac{s}{\sqrt{n}}}$$

- Numerator captures differences
- Denominator acts as 'yardstick' for numerator
- We are testing $\beta = 0$
- Compare to reference distribution to assess significance

Inference for t -statistic

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Inference for t -statistic

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Inference for t -statistic

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Cell Means Model

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

$$y_{ij} = \mu_j + \epsilon_{ij}$$

or

$$y_{tumor1} = \mu_{tumor} + \epsilon_{tumor1}$$

$$y_{normal1} = \mu_{normal} + \epsilon_{normal1}$$

or

$$y_{ij} = I\mu_{tumor} + (1-I)\mu_{normal} + \epsilon_{ij}$$

$$I \in (0, 1)$$

Cell Means Design Matrix

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> design <- model.matrix(~0+pData(colonCA)$class)
> colnames(design) <- c("Normal", "Tumor")
> head(design)
```

	Normal	Tumor
1	0	1
2	1	0
3	0	1
4	1	0
5	0	1
6	1	0

Cell Means Contrast Matrix

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Recall t -statistic:

$$t = \frac{\hat{\beta}}{\frac{s}{\sqrt{n}}}$$

```
> makeContrasts(Tumor - Normal, levels = design)
```

Contrasts

Levels	Tumor - Normal
Normal	-1
Tumor	1

Fit Cell Means Model

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> fit <- lmFit(colonCA, design)
> fit <- contrasts.fit(fit, contrast)
```

Baseline Model

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

$$y_{ij} = \alpha + \tau_j + \epsilon_{ij}$$

or

$$y_{normal1} = \alpha + \epsilon_{normal1}$$

$$y_{tumor1} = \alpha + \tau_1 + \epsilon_{tumor1}$$

or

$$y_{ij} = \alpha + I\tau_j + \epsilon_{ij}$$

$$I \in (0, 1)$$

Baseline Model Design Matrix

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> tumorvnormal <- pData(colonCA)$class  
> design <- model.matrix(~tumorvnormal)  
> colnames(design) <- c("Intercept", "Tumor-Normal")  
> head(design)
```

	Intercept	Tumor-Normal
1	1	1
2	1	0
3	1	1
4	1	0
5	1	1
6	1	0

Fit Baseline Model

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> fit <- lmFit(colonCA, design)
```

Now what?

Sample size

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

The t -statistic (again)

$$t = \frac{\hat{\beta}}{\frac{s}{\sqrt{n}}}$$

Denominator dependent on

- Sample variability
- Number of replicates

Sample variability dependent on

- Number of replicates

eBayes

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Fewer replicates increase variability:

- Mathematically
- By chance

eBayes step estimates 'average' variability over all genes and

- Adjusts high variability genes down
- Adjusts low variability genes up

Filter data

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Things to consider:

- eBayes needs all genes
- Multiple comparisons problem
- Statistical vs biological significance

Selecting 'Top' Genes

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

- eBayes/topTable control output by
 - Coefficient of interest
 - Number of genes
 - p -value (adjusted)
 - Fold change
- treat/topTreat control output by
 - All of the above
 - Incorporates fold change into computation of p -value

Output data

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> fit2 <- eBayes(fit)
> output <- topTable(fit2, coef = 2)
> ## or
> fit2 <- treat(fit)
> output <- topTreat(fit2, coef = 2)
```

Output

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

How do the results for eBayes and treat differ?

Check man pages for how to incorporate fold change.

How do the results differ when adding a fold change criterion?

How would one select genes with a FDR of 5%?

Paired Analysis

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Colon cancer data are actually paired:

```
> head(pData(colonCA))
```

	expNr	samp	class
1	1	-1	t
2	2	1	n
3	3	-2	t
4	4	2	n
5	5	-3	t
6	6	3	n

So how do we handle this aspect?

Paired data

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Paired analysis 'by hand'

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> ind <- pData(colonCA)$samp > 0  
> dat <- exprs(colonCA)[,!ind] -  
+      exprs(colonCA)[,ind]  
> design <- rep(1, ncol(dat))  
> fit <- lmFit(dat, design)  
> fit.pair1 <- eBayes(fit)
```

Paired analysis using batch term

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> pair <- factor(abs(pData(colonCA)$samp))
> design <- model.matrix(~tumorvnormal +
+                          pair)
> colnames(design) <- c("Intercept", "Tumor-Normal",
+                        paste("Pair", 2:22, sep=""))
> head(design)[,1:4]
```

	Intercept	Tumor-Normal	Pair2
1	1	1	0
2	1	0	0
3	1	1	1
4	1	0	1
5	1	1	0
6	1	0	0

	Pair3
1	0
2	0

Paired analysis using batch term

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> fit <- lmFit(colonCA, design)
> fit.pair2 <- eBayes(fit)
> comp <- cbind(fit.pair1$coef, fit.pair2$coef[,2])
> colnames(comp) <- c("Direct", "Batch")
> head(comp)
```

	Direct	Batch
Hsa.3004	0.25	0.25
Hsa.13491	0.14	0.14
Hsa.13491.1	0.22	0.22
Hsa.37254	0.13	0.13
Hsa.541	0.30	0.30
Hsa.20836	0.16	0.16

Estrogen Data

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

```
> pData(estrogen)
```

	sample
high10-1.cel	1
high10-2.cel	2
high48-1.cel	3
high48-2.cel	4
low10-1.cel	5
low10-2.cel	6
low48-1.cel	7
low48-2.cel	8

Comparisons

BioC2010

Introduction

Colon Cancer
Data

Two-group
Filter/Output Data
Paired analysis

Estrogen Data

Comparisons of interest:

- High vs low estrogen
- 10 vs 48 hour incubation
- Interaction

Estrogen Design Matrix

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

What would a cell means design matrix look like?

How would it be constructed?

Hint: See ?formula

How about the contrasts matrix?

Estrogen Design Matrix I

BioC2010

Introduction

Estrogen Data

GSEA

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

No significant genes in interaction.

Does that mean we are done?

Consider genes as a set instead of individually.

- `geneSetTest`
 - Competitive analysis
 - H_0 : Our set of genes no more differentially expressed than the remainder of genes on the chip.
- `roast/romer`
 - Self-contained analysis
 - H_0 : Our set of genes is not differentially expressed.

geneSetTest

BioC2010

Introduction

Colon Cancer
Data

Two-group
Filter/Output Data
Paired analysis

Estrogen Data

Two required arguments:

- 'Indicator' vector for genes of interest
- Vector of statistics

```
> ind <- as.numeric(row.names(topTable(fit2,  
+                                     coef = 4,  
+                                     number = 100,  
+                                     p.value = 0.2))  
> geneSetTest(ind, fit2$t[,4])  
  
[1] 2.3e-14
```

roast

BioC2010

Introduction

Colon Cancer
Data

Two-group

Filter/Output Data

Paired analysis

Estrogen Data

Four required arguments:

- 'Indicator' vector for genes of interest
- Matrix of expression values
- Design matrix
- Contrast matrix

```
> roast(ind, exprs(estrogen), design, c(0,0,0,1))
```

	Active.Prop	P.Value
Mixed	1.00	0.003
Up	0.32	0.990
Down	0.68	0.011
